

AI Collaboration Diligence Statement

Project: Padarozha — A Belarus Travel Discovery App

In creating **Padarozha**, a mobile-first web application designed to help people discover Belarus, I collaborated with **Claude by Anthropic** across all phases of the project — from initial concept and planning through to design decisions, content creation, and technical implementation. I affirm that all AI-generated and co-created content underwent thorough personal review and evaluation. The final output accurately reflects my understanding, expertise, and intended meaning. While AI assistance was instrumental throughout the process, I maintain full responsibility for the content, its accuracy, and its presentation.

Creation diligence

Which AI system was used and why

I chose Claude by Anthropic as my AI collaborator, specifically targeting this tool as part of my journey toward Claude certification. Claude's conversational depth and ability to engage with creative, strategic, and technical tasks in a single session made it the right fit for a project of this scope.

What data or information was shared

I shared my personal experiences of travelling in Belarus — including SUP boarding on rivers and lakes, knowledge of local places and cultural heritage — alongside publicly available information about Belarusian geography, history, nature reserves, and landmarks. No private or sensitive personal data was involved.

Privacy, security, and ethical considerations

All content and assets targeted open, freely available sources. Photos were sourced from Unsplash under their free-use licence. Place information draws on publicly available knowledge. No proprietary, private, or restricted data was used at any stage of the project.

Transparency diligence

Intended audience

Padarozha is designed for anyone who wants to explore Belarus — primarily Belarusians who may not fully know their own country, and travellers curious about what lies beyond the well-known highlights.

AI disclosure expectations

As a personal pet project and portfolio piece, the audience is not expected to have specific AI disclosure requirements. However, transparency about the collaborative process is offered here in the spirit of honesty and as a professional practice.

How AI contributed to different aspects of the work

- > Strategic planning — defining the project vision, scope, delegation framework, and phased project plan
- > Content creation — shaping the host voice and writing or refining descriptions for all 26 seed places
- > Design decisions — discussing visual identity, colour palette, typography, and UX patterns
- > Technical implementation — writing all React, Tailwind, and JavaScript code for the frontend application
- > Quality and iteration — responding to feedback and refining outputs across multiple rounds of review

Deployment diligence

Verification and accuracy checks

All place names, descriptions, geographical assignments, and practical information were cross-checked against publicly available sources including Google Maps and general knowledge of Belarus. Factual corrections — such as the correct region assignments for Stracha River and Krasnoselsky Chalk Quarries — were made during the review process based on personal knowledge.

Quality assurance process

Each phase of AI output was reviewed personally before being accepted. Design changes were evaluated visually on both desktop and mobile. Written descriptions were reviewed for tone, accuracy, and alignment with the host-guest voice established at the outset. Feedback was given iteratively and revisions were assessed before deployment.

Responsibility for the final product

Padarozha is a personal pet project built for exploration, learning, and portfolio purposes. I take full and unconditional responsibility for all content, design decisions, technical choices, and the overall presentation of the application. The use of AI assistance does not diminish or transfer that responsibility in any way.

This statement is made in the spirit of transparency, professional integrity, and to acknowledge the role of AI in the creation process.
